

Increment and Decrement Operator

- Here we have pre and post increment
- For example :

```
Int x = 5;
```

```
x++;           // post increment
```

```
++x;          // pre increment
```

- Although they both give the same ans however their working is different
- In post increment it first use the value of x then increment x
- In pre increment it first increment x then use it
- This works on float , byte and char as well
- Only on boolean type this operations does not work
